BIOCHEMISTRY

Test Name (Methodology)	Result	Flag	Units	Biological Reference Interval
HbA1c – Glycated Haemoglobin	4.6			

Glycated Haemoglobin,
HbA1c (TINIA)

H %

Non-diabetic range: 4.8-5.6

Prediabetic range: 5.7-6.4%

Diabetes range: $\geq 6.5\%$

High risk $> 7.0\%$ Mg/dl

Estimated Average Glucose
Test Observations:

Note: HbA1c results may vary in situations of abnormal red cell turnover, such as pregnancy, recent blood loss or transfusion, or some anaemias. In such cases only blood glucose criteria should be used to diagnose diabetes (ADA, 2014). Please correlate clinically.

Thyroid Profile - I

BIOCHEMISTRY

T3 - Total (Tri Iodothyronine) (Serum)

T3 - Total (Tri Iodothyronine)
ECLIA

148.5

80.00 - 200.00

ng/dL

T4 - Total (Thyroxine - Total) (Serum)

T4 - Total (Thyroxine - Total)
ECLIA

7.75

5.1-14.1

µg/dL

Interpretation:

Note :

1. Total T3 & T4 levels measure the hormone which is in the bound form and is not available to most tissues.
2. Severe systemic illness affects the thyroid binding proteins and can falsely alter Total T 4 levels in the absence of a primary thyroid disease. Hence Free T3 & T4 levels are recommended for accurate assessment of thyroid dysfunction.

TSH, Thyroid Stimulating Hormone (Serum)

TSH, Thyroid Stimulating Hormone
ECLIA

1.230

Non pregnant women: 0.27-4.2 µIU/mL
Pregnant women
1st trimester: 0.1-2.5
2nd trimester: 0.2-3.0
3rd trimester: 0.3-3.0

Interpretation:

The following potential sources of variation should be considered while interpreting thyroid hormone results:

1. Circadian variation in TSH secretion: peak levels are seen between 2-4 am. Minimum levels seen between 6-10 am. This variation may be as much as 50% thus, influence of sampling time needs to be considered for clinical interpretation.
2. Total T3 and T4 levels are seen to have physiological rise during pregnancy and in patients on steroid treatment
3. Circulating forms of T3 and T4 are mostly reversibly bound with Thyroxine binding globulins (TBG), and to a lesser extent with albumin and Thyroid binding Pre-Albumin. Thus the conditions in which TBG and protein levels alter such as chronic liver disorders, pregnancy, excess of estrogens, androgens, anabolic steroids and glucocorticoids may cause misleading total T3, total T4 and TSH interpretations.
4. T4 may be normal in the presence of hyperthyroidism under the following conditions : T3 thyrotoxicosis, Hypoproteinemia related reduced binding, in presence of drugs (eg Phenytoin, Salicylates etc)
5. Neonates and infants have higher levels of T4 due to increased concentration of TBG
6. TSH levels may be normal in central hypothyroidism, recent rapid correction of hypothyroidism or hyperthyroidism, pregnancy, phenytoin therapy etc.
7. TSH values of <0.03 uIU/mL must be clinically correlated to evaluate the presence of a rare TSH variant in certain individuals which is undetected by conventional methods.
8. Presence of Autoimmune disorders may lead to spurious results of thyroid hormones
9. Various drugs can lead to interference in test results

It is recommended to evaluate unbound fractions, that is free T3 (fT3) and free T4 (fT4) for clinic-pathologic correlation, as these are the metabolically active forms.
